# Chapter 1

## SEM and R

This is the starting point.

## Chapter 2

# Introduction

The following R codes are from UCLA website “<https://stats.idre.ucla.edu/r/seminars/rsem/>” and I do not own the copyright of the R code. I wrote this R Markdown file for my own study purpose.

**Given this consideration, please do NOT distribute this page in any way.**

### 2.1 Definitions (Basic Concepts)

#### 2.1.1 Observed variable

Observed variable: A variable that exists in the data (a.k.a item or manifest variable)

#### 2.1.2 Latent variable

Latent variable: A variable that is constructed and does not exist in the data.

#### 2.1.3 Exogenous variable

Exogenous variable: An independent variable either observed ( $X$ ) or latent ( $\xi$ ) that explains an endogenous variable.

### 2.2 Read the data into the R Studio environment.

It also calculates the covariance matrix among all the variables in the data.

```
dat <- read.csv("https://stats.idre.ucla.edu/wp-content/uploads/2021/02/worland5.csv")
cov(dat)
```

```
##      motiv harm stabi ppsych ses verbal read arith spell
## motiv    100   77    59   -25  25    32   53    60    59
## harm      77   100    58   -25  26    25   42    44    45
## stabi     59    58   100   -16  18    27   36    38    38
## ppsych   -25   -25   -16   100 -42   -40  -39   -24   -31
## ses       25    26    18   -42 100    40   43    37    33
## verbal    32    25    27   -40  40   100   56    49    48
## read      53    42    36   -39  43    56  100    73    87
## arith     60    44    38   -24  37    49   73   100    72
## spell     59    45    38   -31  33    48   87    72   100
```

In the following, we conduct a simple linear regression.

$$\text{sample variance - covariance matrix } \hat{\Sigma} = \mathbf{S}$$

```
m1a <- lm(read ~ motiv, data=dat)
(fit1a <-summary(m1a))
```

```
##
## Call:
## lm(formula = read ~ motiv, data = dat)
##
